

KONSTANTIN PROKHOROV

UNITY DEVELOPER (GAMEPLAY & SYSTEMS)

Based in Serbia · CET/CEST · Open to Remote / B2B / Relocation
Email: wundte@gmail.com | LinkedIn: [linkedin.com/in/constantin-prokhorov](https://www.linkedin.com/in/constantin-prokhorov) | Telegram: @konstantin_game_development
GitHub: github.com/Wundte

PROFESSIONAL SUMMARY

Unity Developer (Gameplay & Systems) with over 6 years of experience designing scalable gameplay architectures, Game AI systems, ECS-based solutions, and developing gameplay features and developer tooling for Unity and Godot, with hands-on experience with AI-assisted development. Worked across hypercasual mobile titles, highly regulated gambling platforms, and complex PC strategy games, with a strong focus on performance, scalability, and developer experience.

CORE EXPERTISE

Gameplay & Systems: Gameplay Programming, Gameplay Architecture, ECS, Data-Oriented Design, Object-Oriented Design, Design Patterns, Dependency Injection, Game AI, Gameplay Physics, PhysX, Game Mechanics, UI Systems

Unity & Engineering: C#, Unity Engine, Custom Inspectors, ScriptableObjects, Addressables, PhysX, UGUI, TextMeshPro, Cinemachine, Shader Graph, Tweening Frameworks (DOTween), UniTask, Async Programming, UniRx, Reactive Programming, Unity Profiler, Frame Debugger, Third-party SDK Integration, Performance Optimization, Memory Optimization, Multithreading, Automated Testing, TDD

Tools & Production: Unity Editor Extensions, Property Drawers, Gizmos & Debug Visualization, Developer Tools, Code Generation, Git Version Control, Git Hooks, A/B Testing

Leadership: Code Reviews, Developer Mentoring, Cross-team Collaboration, Licensing & Compliance Preparation

AI-Assisted Development: AI Coding Agents, Multi-agent Workflows, AI-assisted Code Generation, AI-assisted Code Review

PROFESSIONAL EXPERIENCE

Unity Developer (Gameplay & Systems) Assaulter Games	Jul 2024 – Present
• Built a turn-based roguelike strategy game from initial prototype to a playable demo as the sole engineer responsible for gameplay systems, architecture, tools, and technical infrastructure within a three-person team. Delivered a complete playable build validated through public playtests, showcased at gaming events in Istanbul and Montenegro, and presented to potential publishers. • Designed and implemented core gameplay systems using an extended ECS and data-oriented architecture, including combat, movement, pathfinding, visibility, and progression. Built reusable and data-driven systems that enabled rapid iteration and efficient implementation of new mechanics and content. • Integrated automated testing to maintain code stability and reduce regressions during rapid gameplay iteration. • Developed a multithreaded Game Utility AI system for NPC decision-making and a data-oriented gameplay architecture capable of evaluating large numbers of agents concurrently while maintaining stable frame rates. • Eliminated runtime allocations in critical gameplay loops through object pooling, parallelized processing, and performance-oriented design, achieving stable 60 FPS on low-end laptops (FullHD). • Designed and implemented a reactive UI architecture integrated with ECS gameplay states using a non-allocating observer pattern, enabling independent iteration of UI and gameplay logic. • Built a suite of internal developer tools, including code-generation pipelines, type-safe modifier tooling, and runtime ECS visualization. Created a data-driven content workflow enabling game designers to independently configure units, buildings, maps, abilities, modifiers, and gameplay scenarios through designer-facing interfaces. • Designed a multi-agent AI development workflow using Claude Code, with specialized agents for requirements, architecture, code generation, and code review, each configured with role-specific skills, tools, and reasoning levels. • Used AI-assisted development to accelerate gameplay implementation, developer tooling, custom inspectors, automated tests, and documentation. Applied AI-assisted verification to check code against architectural documentation and coding standards, increasing codebase consistency and test coverage while reducing regression risk and development time.	

Unity Developer | DOO Black Cube (a NOVOMATIC subsidiary)**Nov 2022 – Jul 2024**

- Led and coordinated the studio's migration from Unity to Godot while retaining the C# technology stack, preserving developer productivity and existing expertise while reducing long-term engine licensing costs.
- Architected core gameplay systems and mathematical verification models for multiple regulated gambling products.
- Developed proprietary high-performance simulation and validation tools in Rust, combining analytical probability calculations with Monte Carlo simulations to automate million-spin simulations and mathematical verifications. Eliminated game designers' dependency on mathematicians for routine balancing by replacing manual calculations with automated validation, significantly accelerating gameplay iteration.
- Mentored and coordinated up to four junior and mid-level developers, assigning technical tasks, conducting structured code reviews, and leading onboarding.
- Introduced Agile/Scrum workflows, Test-Driven Development (TDD), and automated testing into the development pipeline, reducing manual QA from two full-time freelance testers to a single in-house QA engineer.
- Coordinated with external compliance teams, freelance artists, and composers, ensuring technical integration and that assets met established performance requirements and production deadlines.
- Adopted early AI-assisted development tools, including GitHub Copilot and early versions of ChatGPT, using AI code completion to speed up implementation of routine and straightforward methods and reduce time spent on repetitive coding tasks.

Junior Unity Developer | Octavian Game Art**Mar 2020 – May 2021****Middle Unity Developer | Octavian Game Art****May 2021 – Nov 2022**

- Developed and delivered multiple hypercasual games for iOS, Android, and WebGL, taking projects from rapid prototypes to soft launch while implementing core gameplay mechanics and meta-progression systems.
- Integrated analytics, telemetry, advertising, and monetization SDKs, enabling A/B testing and providing reliable player data to support data-driven gameplay and monetization decisions.
- Built reusable gameplay modules and a shared Git submodule containing common infrastructure such as scene loading and object pooling, reducing development time and enabling the team to produce more prototypes for publisher evaluation and market validation, ultimately contributing to reaching the studio's break-even threshold.
- Replaced Unity's built-in physics system with custom lightweight simulations where full physics was unnecessary, including projectile trajectory calculations, collision detection, and other gameplay-specific systems, helping maintain a stable 60 FPS even on low-end mobile devices.
- Introduced performance-oriented technical guidelines for game assets, defining requirements for models, textures, particle effects, and other content, improving rendering efficiency and overall project performance.

SELECTED PROJECTS & HIGHLIGHTS

Turn-Based Roguelike Strategy (Unity): Designed ECS and data-oriented architecture, implemented multithreaded Game Utility AI, reactive UI systems, asynchronous content loading, and comprehensive designer and debugging tools. Gameplay Video: <https://youtu.be/tQ7eGwTYTb0> | <https://github.com/Wundte/EcsStateMachine>

Godot Slot Product & Rust Simulator: Engineered core slot game logic and built high-performance Rust-based simulation tools for extensive verification and rapid game design iteration. Gameplay Video: <https://youtube.com/shorts/5QjBtg1GJho>

Hypercasual Mobile Ecosystem (Unity): Rapidly iterated structural gameplay prototypes tailored for fast-paced publisher evaluations and market validation.
